This tutorial shows how to calculate areas/probabilities using the cumulative standard normal distribution table. The table provides the area under the standard normal curve to the left of a given z-score. For example, if the z-score is 1.96, the area to the left is 0.9750. This means that 97.5% of the data falls below 1.96 standard deviations above the mean. The area to the right is 1 - 0.9750 = 0.0250. This is useful for finding probabilities in the tails of the distribution. For instance, the probability of a value being greater than 1.96 standard deviations above the mean is 0.0250. The table is symmetric about the mean (z=0). The area to the left of -1.96 is 0.0250, and the area to the right of -1.96 is 0.9750. The table is essential for hypothesis testing and confidence interval estimation.
